

# Configuration of the Elsner P03/3 weather station

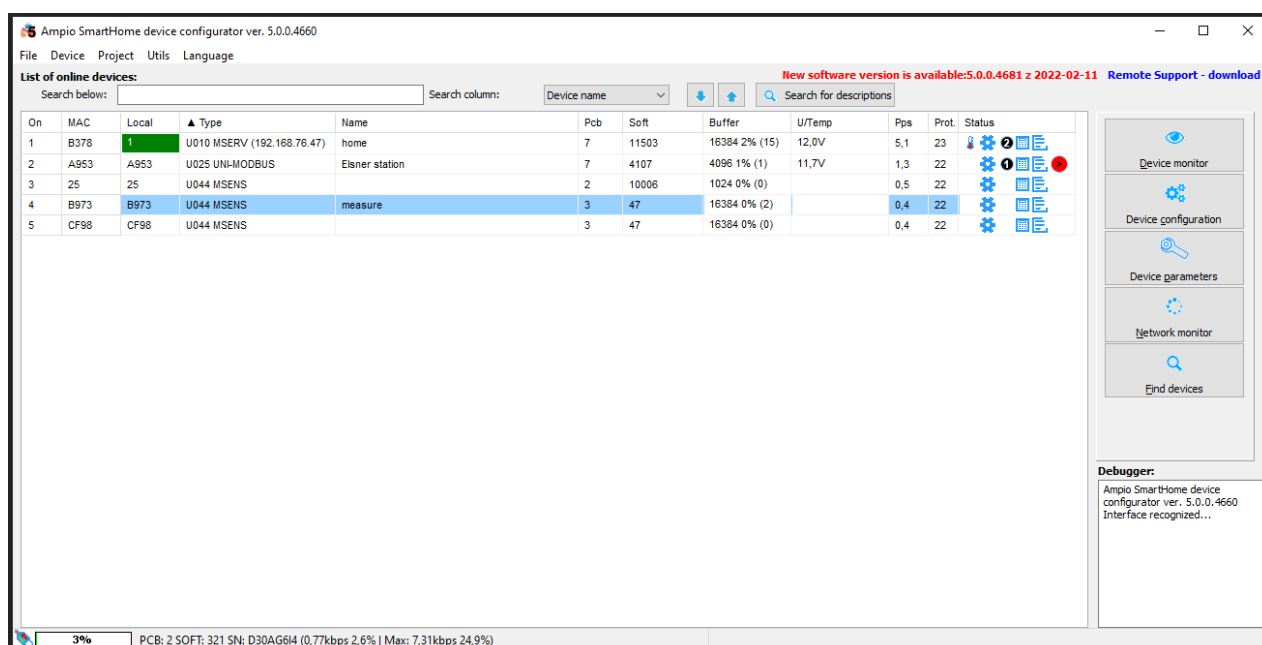

Document number: PO-083-EN Version: 1.0 Date of publication: March 4, 2022

## Introduction

In the Ampio system, it is possible to use software dedicated to a specific device, for example, for the Elsner P03/3 meteorological station. It is important to remember that the stations are available in a number of different variants.

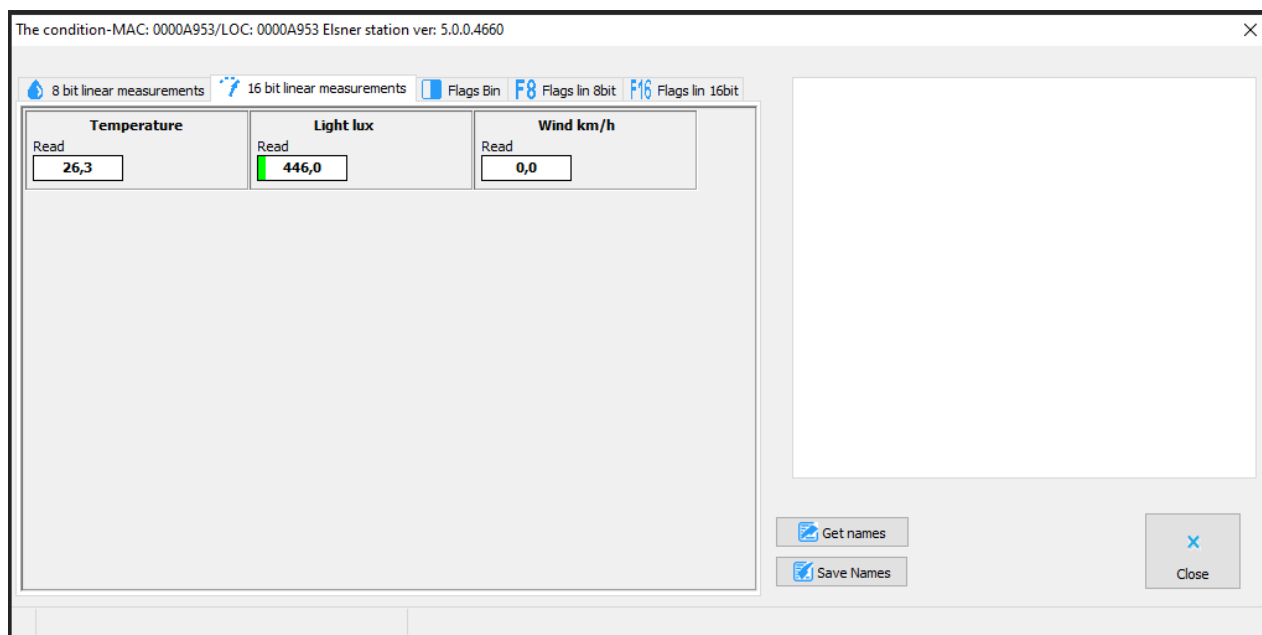

## Configuration

You begin with connecting the weather station to an M-CON-485 module. The station and the module must be supplied with adequate power, as specified in their documentation. Then, open the CAN configurator.

Select the M-CON-485 module and choose the dedicated software in accordance with the table presented in the [RS-485 integration module](#) installer guide. For the purpose of this guide, the software number 1204 has been chosen. In the configurator, go to *Device -> Update* and pick a file, e.g. *ampio\_T25\_P3\_S1204.amp*. Wait for the update to install. Thanks to the dedicated software, you will not have to set the device parameters.

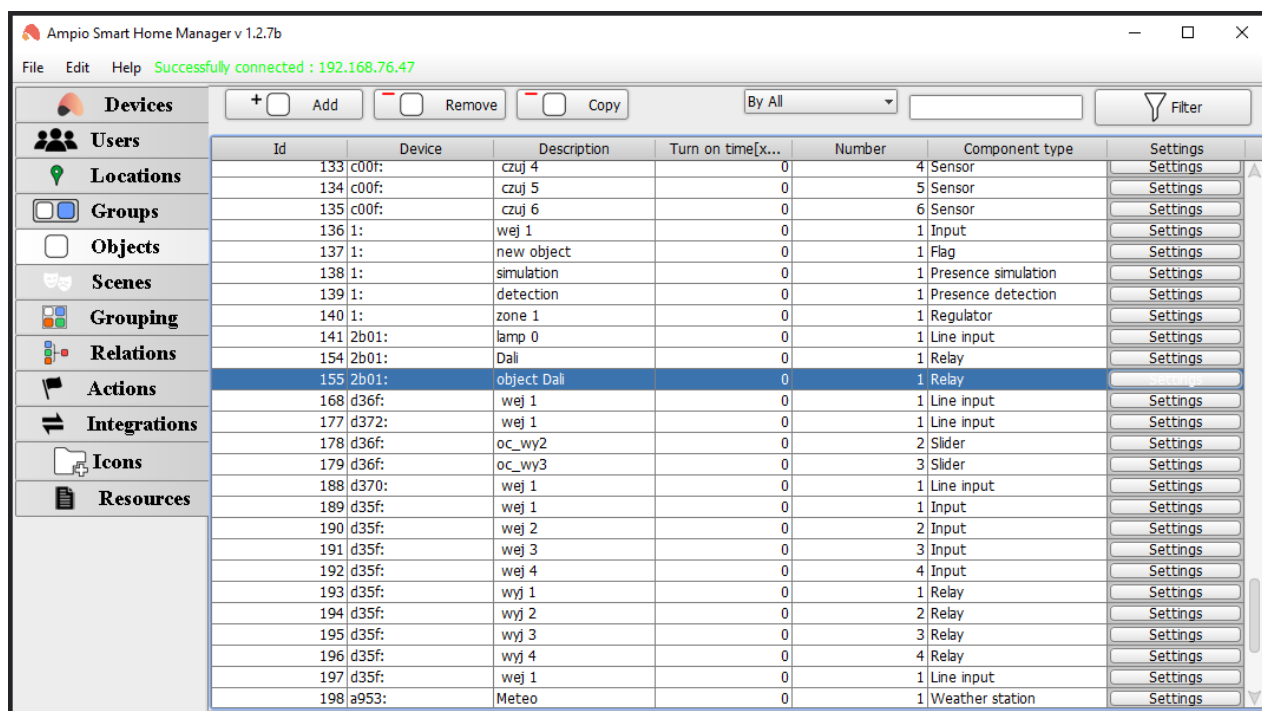

The current values can be viewed in the *Device monitor*.

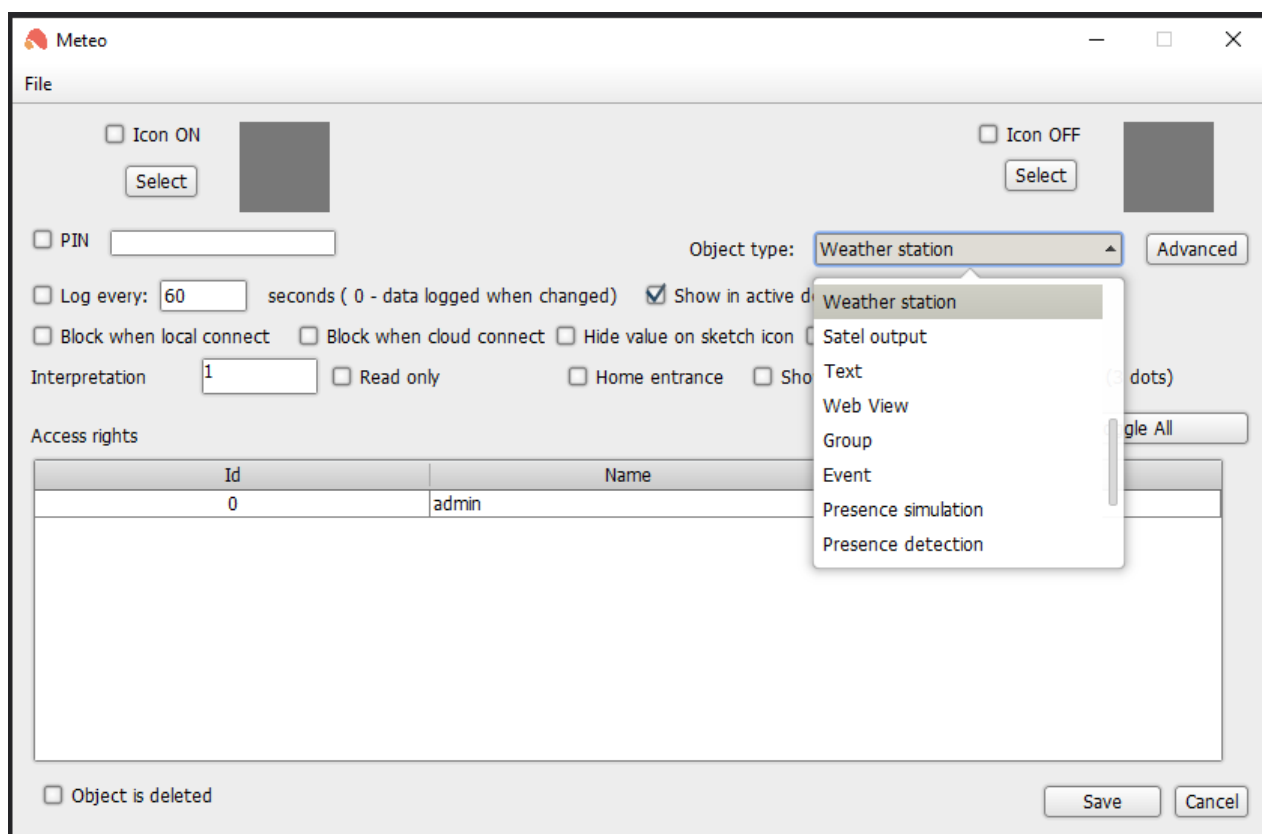

## Smart Home Manager

Installing the dedicated software allows you also to create a dedicated object in the Ampio Smart Home Manager application and to display it in the Ampio UNI mobile app.

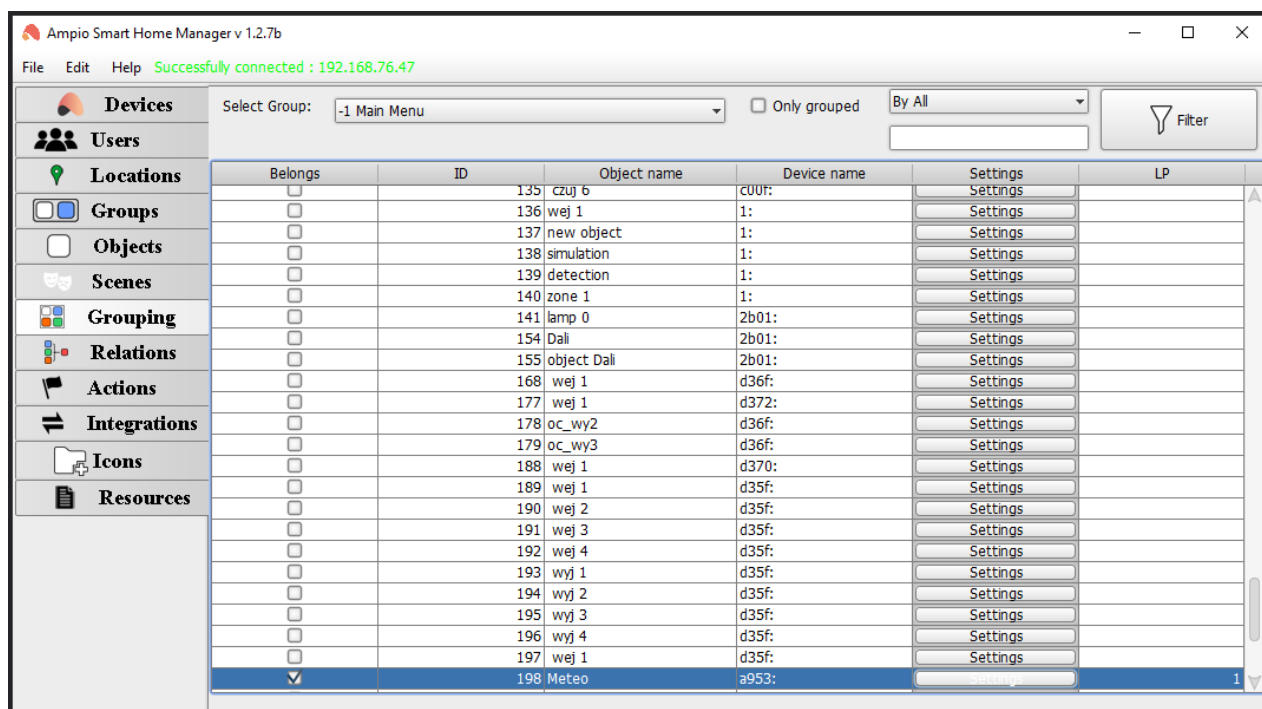

Log into the Ampio Smart Home Manager application, go to the *Objects* tab and add an object (+ Add).

In the Device column, select the M-CON-485 module's MAC address. Then, go to the object's *Settings*. Open the drop-down menu of the *Device type* field and select *Weather station*, then click *Save*.

Next, go to the *Grouping* section and select the group in which the object Weather station must be displayed (here, it is the *-1 Main menu* group).

Upload the settings via *Edit -> Save configuration to the server* (or with the use of a shortcut: *Ctrl+S*). Once that is done, you will be able to see the parameters from the weather station in your Ampio UNI application.
